All figures have been rounded to the nearest one decimal place. This means that countries may appear to have the same score, or the change over time may appear inaccurate, but this is not the case when all decimal places are taken into account. Countries have been ranked and trends have been described on the basis of full scores not the rounded numbers that appear here.

Regional Economic Community (REC) averages are calculated by applying the REC's current membership configuration for all data years.

The Mo Ibrahim Foundation (MIF) is aware that some sources update their data sets after our documentation is sent to print. IIAG raw data are correct as per the date 'last accessed', which is stated for each indicator within the Data Portal ([www.moibrahimfoundation.org/iiag/downloads/](http://www.moibrahimfoundation.org/iiag/downloads/)).

South Sudan and Sudan are excluded from all group averages pre-2011 as neither country existed in their current configurations before the secession of South Sudan in 2011.

The Ibrahim Index of African Governance (IIAG) measures the quality of governance in every African country on an annual basis. It does this by compiling data from diverse global sources to build an accurate and detailed picture of governance performance in African countries.

The broad aim of the IIAG is to better inform and sustain the debate on African governance by providing a transparent and user-friendly resource to:

- support citizens, governments, institutions and the private sector to accurately assess the delivery of public goods and services, and policy outcomes.

- encourage data-driven narratives on governance issues.
- help determine, debate and strengthen government performance.

The IIAG was created in 2007 in recognition of the need for a quantifiable tool to accurately measure and monitor African governance performance, its progress over time and across countries, and as a means of supporting effective and responsive solutions to complex public policy challenges in developing countries. Policies need to be evaluated by their results, which can only be done if accompanied by robust data.
